

# How to sync issue links on Jira Cloud

JIRA CLOUD

This article shows an example of how to synchronize issue links on Jira Cloud.

## Configuration

Let's consider you already have the Connection configured between the Instances.

Now you need to **configure issue links synchronization**:

Configure Sync Rules with the scripts provided below:

 **Add the snippets below to the new line in the end of the existing scripts.**

## Source side

### Outgoing sync

```
replica.issueLinks = issue.issueLinks
```

## Destination side

### Incoming sync

```
issue.issueLinks = replica.issueLinks
```

### Attention!

- You should separately synchronize all issues that are linked to a specific issue to keep an association between them on the Destination side.

#### **Example**

Sync between projects **DEV** and **TEST**;

issue **DEV-1** is linked to issue **DEV-2**;

sync issue **DEV-1** to **TEST-1**;

*TEST-1 still is not associated with any other issue*

sync issue **DEV-2** to **TEST-2**;

as a result, you will get a link between remote issues on the **TEST** project (**TEST-1** and **TEST-2**)
