

# Exalate for Jira Cloud: Displaying a remote issue link in a custom field

JIRA CLOUD

HP ALM/QC

ZENDESK

This article shows how to synchronize the remote issue link to a custom field on destination instance.

## Destination side

1. Add a URL custom field. Let's name it `remoteIssueUrl`.

Check out Atlassian documentation for more information about custom fields:

[Adding a custom field](#)

2. Add the code below into the **Incoming sync**

```
// remoteIssueUrl is provided in the incoming sync script  
issue.customFields."Remote issue URL".value = remoteIssueUrl
```

"Remote issue URL " is the name of the custom field, you've created in the first step. You can change it to any custom name.
